STATINTL

Dear Dick:

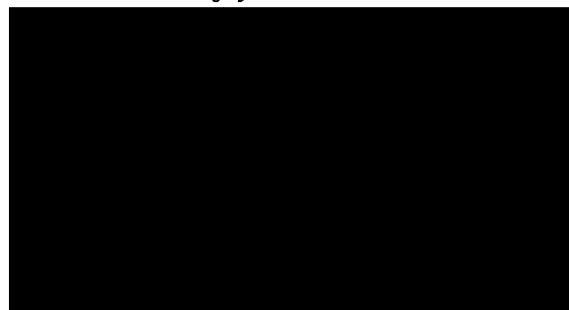

The enclosed chip of "Clear" film has a couple of "negative" targets inside the circle.

You will find that the upper target (near the center of the circle) has a couple of groups resolved. Both of these have been checked out at 1000 lines/mm or better.

The exposure was very critical so I concentrated on the 1000 line groups and ignored the overexposure on the other groups.

At this point we are quite confident that we can produce targets which will keep you happy.

Sincerely,

STATINTL

HM:a
Enc.
